Report Number: 0312-0151
Unit Number: K001045158
Pt Type: REG CLI
Acct Num: N00002122197

MRI Brain WWO IV Contrast

PATIENT COPY

MRI of the Brain (Without and With Contrast)

Contrast: 15 mL intravenous Multihance without complication.

History: Followup traumatic brain injury, MVA

Comparison: outside MRI 2/8/15

Technique: Sagittal and axial T1-weighted images. Axial fast T2 2nd echo, GRE, diffusion and FLAIR images. Postgadolinium axial and coronal images.

Findings: Prior extremely thin subdural blood collections have resolved. Small focal field dropouts on gradient imaging in the region of the left caudate head and involving the cortex of both parietal vertex regions are stable and consistent with sites of micro bleeding /shearing injury. Diffusion hyperintensity in the left posterior frontal periventricular white matter has resolved. There is no midline shift or intracranial edema. The ambient cistern is patent. Ventricular size is normal. There are no areas of abnormal gadolinium enhancement. Prior sinus disease has resolved. A stable prominent cisterna magna is incidentally noted.

Impression: Evidence for TBI persists. Nothing acute is detected.
